**Title of the project: WEATHER – IO: WEATHER APP**

### **Abstract:**

Weather forecasting is the attempt by meteorologists to predict the weather conditions at some future time and the weather conditions that may be expected. The climatic condition parameters are based on the temperature, wind, humidity, rainfall and size of data set. In front-end development, an app abstract is a brief description of the application's purpose, functionality, and key features. The app's primary focus is to deliver real-time weather information to users, helping them stay prepared for varying weather conditions. The application leverages modern front-end technologies to create an interactive and visually appealing experience. Users can access this information based on their location or search for specific cities to get accurate weather updates. Weather apps are popular for helping users plan their activities, travel, and stay prepared for any weather changes.

**Keywords:** Weather forecast, Weather conditions, Temperature, Wind speed, Humidity.
